AGROHORTICULTURAL COMPOSITION AND METHOD FOR
USE THEREOF

INS
A1

TECHNICAL FIELD

The present invention relates to an aromatic
diamide derivative or a salt thereof; an agrohorti-
cultural composition, particularly an agrohorticultural
5 insecticide both containing the derivative or the salt
as an effective ingredient; and a method for using the
same.

BACKGROUND ART

A compound similar to the aromatic diamide
10 derivative represented by the general formula (I) of
the present invention is disclosed in EP 919542 A2.

DISCLOSURE OF THE INVENTION

The present inventors made an intensive study
in order to develop a novel agrohorticultural
15 composition, particularly an agrohorticultural
insecticide and, as a result, found out that an
aromatic diamide derivative represented by the general
formula (I) or a salt thereof according to the present
invention is a novel compound not described in any
20 literature and is useful as an agrohorticultural
composition, particularly as an agrohorticultural

insecticide. The present invention has been completed based on the above finding.

The present invention relates to an aromatic diamide derivative represented by the following general formula (I) or a salt thereof; an agrohorticultural composition, particularly an agrohorticultural insecticide; and a method for using the insecticide:

15 temperature to the refluxing temperature of the inert solvent used. The reaction time varies depending upon, for example, the size or temperature of reaction, but can appropriately be determined in a range of several minutes to 48 hours.

20 After the completion of the reaction, the reaction mixture containing an intended product is subjected to an isolation treatment according to an ordinary method and, as necessary, purification is conducted by recrystallization, column chromatography
25 or the like, whereby the intended product can be obtained.

This carboxamide (VI-1) is subjected to the

following procedure after being isolated or without being isolated. That is, the carboxamide (VI-1), wherein R^3 is a hydrogen atom, is subjected to a condensation reaction in the presence of a condensation agent to obtain a compound represented by the general formula (VII-1) and this compound (VII-1) is reacted, after being isolated or without being isolated, with an amine represented by the general formula (V) in the presence of an inert solvent; or, the carboxamide (VI-1), wherein R^3 is other than hydrogen atom, is condensed with an amine represented by the general formula (V) in the presence of a condensation agent; thereby, an aromatic diamide derivative represented by the general formula (I-1) can be produced.

The agrohorticultural composition,
 particularly, agrohorticultural insecticides containing
 the aromatic diamide derivative represented by formula
 (I) or salt thereof of the present invention has a
 20 marked controlling effect on the above-exemplified
 insect pests, sanitary pests and/or nematodes, which
 are injurious to paddy field crops, upland crops, fruit
 trees, vegetables and other crops, flowers and ornament
 plants, and the like. Therefore, the desired effect of
 25 the agrohorticultural insecticide of the present
 invention can be exhibited by applying the insecticide
 to the paddy field water, stalks and leaves or soil of
 paddy field, upland field, fruit trees, vegetables,

other crops or flowers and ornament plants at a season at which the insect pests, sanitary pests or nematodes are expected to appear, before their appearance or at the time when their appearance is confirmed.

5 In general, the agrohorticultural composition of the present invention is used after being prepared into conveniently usable forms according to ordinary manner for preparation of agrochemicals.

That is, the aromatic diamide derivative of
10 formula (I) or salt thereof and an appropriate carrier are blended optionally together with an adjuvant in a proper proportion and prepared into a suitable preparation form such as suspension, emulsifiable concentrate, soluble concentrate, wettable powder,
15 granules, dust or tablets through dissolution, separation, suspension, mixing, impregnation, adsorption or sticking.

The inert carrier used in the present invention may be either solid or liquid. As the solid
20 carrier, soybean flour, cereal flour, wood flour, bark flour, saw dust, powdered tobacco stalks, powdered walnut shells, bran, powdered cellulose, extraction residues of vegetables, powdered synthetic polymers or resins, clay (e.g. kaolin, bentonite and acid clay),
25 talc (e.g. talc and pyrophyllite), silica materials (e.g. diatomaceous earth, siliceous sand, mica, white carbon, i.e. synthetic high-dispersion silicic acid, also called finely divided hydrated silica or hydrated

silicic acid, some of the commercially available products contain calcium silicate as the major component), activated carbon, powdered sulfur, pumice, calcined diatomaceous earth, ground brick, fly ash, sand, calcium carbonate, calcium phosphate and other inorganic or mineral powders, chemical fertilizers such as ammonium sulfate, ammonium phosphate, ammonium nitrate, urea, ammonium chloride and the like, and compost. These carriers may be used either alone or as a mixture of two or more carriers.

The liquid carrier is that which itself has a solubility or which is without such solubility but is capable of dispersing an active ingredient with the aid of an adjuvant. The following are typical examples of the liquid carrier and can be used alone or as a mixture thereof. Water; alcohols such as methanol, ethanol, isopropanol, butanol and ethylene glycol; ketones such as acetone, methyl ethyl ketone, methyl isobutyl ketone, diisobutyl ketone and cyclohexanone; ethers such as ethyl ether, dioxane, cellosolve, dipropyl ether and tetrahydrofuran; aliphatic hydrocarbons such as kerosene and mineral oil; aromatic hydrocarbons such as benzene, toluene, xylene, solvent naphtha and alkylnaphthalene; halogenated hydrocarbons such as dichlorethane, chloroform, carbon tetrachloride and chlorobenzene; esters such as ethyl acetate, diisopropyl phthalate, dibutyl phthalate and dioctyl phthalate; amides such as dimethylformamide,

diethylformamide and dimethylacetamide; nitriles such as acetonitrile; and dimethyl sulfoxide.

The following are typical examples of the adjuvant, which are used depending upon purposes and
5 used alone or in combination of two or more adjuvants in some cases, or need not to be used at all.

To emulsify, disperse, dissolve and/or wet an active ingredient, a surfactant is used. As the surfactant, there can be exemplified polyoxyethylene
10 alkyl ethers, polyoxyethylene alkylaryl ethers, polyoxyethylene higher fatty acid esters, polyoxyethylene resinsates, polyoxyethylene sorbitan monolaurate, polyoxyethylene sorbitan monooleate, alkylarylsulfonates, naphthalene-sulfonic acid
15 condensation products, ligninsulfonates and higher alcohol sulfate esters.

Further, to stabilize the dispersion of an active ingredient, tackify it and/or bind it, there may be used adjuvants such as casein, gelatin, starch,
20 methyl cellulose, carboxymethyl cellulose, gum arabic, polyvinyl alcohols, turpentine, bran oil, bentonite and ligninsulfonates.

To improve the flowability of a solid product, there may be used adjuvants such as waxes,
25 stearates and alkyl phosphates.

Adjuvants such as naphthalenesulfonic acid condensation products and polycondensates of phosphates may be used as a peptizer for dispersible products.

Adjuvants such as silicone oil may also be used as a defoaming agent.

The content of the active ingredient may be varied according to the need. For example, in dusts or 5 granules, the suitable content thereof is from 0.01 to 50% by weight. In emulsifiable concentrate and flowable wettable powder, too, the suitable content is from 0.01 to 50% by weight.

The agrohorticultural composition,
10 particularly agrohorticultural insecticide of the present invention is used to control a variety of insect pests in the following manner. That is, it is applied to a crop on which the insect pests are expected to appear or a site where appearance of the
15 insect pests is undesirable, as it is or after being properly diluted with or suspended in water or the like, in an amount effective for control of the insect pests.

The agrohorticultural composition,
20 particularly the agrohorticultural insecticide of the present invention can also be used to, for example, seeds of plants to be protected from pests, or to cultivation carriers in which the above seeds are to be sown (e.g. sowing soil, nursery mat, water, etc.); and
25 can be used by a method such as application to rice nursery bed, seed dressing, seed disinfection or the like. When applied to pests which verminate in upland crops such as fruit trees, grains, vegetables and the

like, it can be used by seed treatments such as dressing, soaking and the like, or by drenching or surface spraying/watering to, for example, seedling-raising carriers such as cultivation vessel, planting
5 hole and the like to allow the crops to absorb the present insecticide, or by application to water culture solution for water culture.

The applying dosage of the agrohorticultural composition of the present invention is varied
10 depending upon various factors such as a purpose, insect pests to be controlled, a growth state of a plant, tendency of insect pests appearance, weather, environmental conditions, a preparation form, an application method, an application site and an
15 application time. It may be properly chosen in a range of 0.1 g to 10 kg (in terms of active ingredient compound) per 10 ares depending upon purposes.

The agrohorticultural composition of the present invention may be used in admixture with other
20 agricultural and horticultural disease or pest controllers in order to expand both spectrum of controllable diseases and insect pest species and the period of time when effective applications are possible or to reduce the dosage.

Test Example 1: Insecticidal effect on diamond back
5 moth (Plutella xylostella)

Adult diamond back moths were released and allowed to oviposit on a Chinese cabbage seedling. Two days after the release, the seedling having the eggs deposited thereon was immersed for about 30 seconds in
10 a liquid chemical prepared by diluting a preparation containing each compound listed in Tables 1 to 3 as an active ingredient to adjust the concentration to 50 ppm. After air-dryness, it was allowed to stand in a room thermostatted at 25°C. Six days after the
15 immersion, the hatched insects were counted. The mortality was calculated according to the following equation and the insecticidal effect was judged according to the criterion shown below. The test was carried out with triplicate groups of 10 insects.

$$\text{Corrected mortality(\%)} = \frac{\begin{array}{c} \text{Number of} \\ \text{hatched insects} \\ \text{in untreated group} \end{array} - \begin{array}{c} \text{Number of} \\ \text{hatched insects} \\ \text{in treated group} \end{array}}{\begin{array}{c} \text{Number of} \\ \text{hatched insects} \\ \text{in untreated group} \end{array}} \times 100$$

20 Criterion:

A --- Mortality 100%

B --- Mortality 99-90%

C --- Mortality 89-80%

D --- Mortality 79-50%

Test Example 2: Insecticidal effect on Common cutworm
(Spodoptera litura)

- 5 A piece of cabbage leaf (cultivar; Shikidori)
was immersed for about 30 seconds in a liquid chemical
prepared by diluting a preparation containing each
compound listed in Tables 1 to 3 as an active
ingredient to adjust the concentration to 500 ppm.
- 10 After air-dryness, it was placed in a plastic Petri
dish with a diameter of 9 cm and inoculated with
second-instar larvae of common cutworm, after which the
dish was closed and then allowed to stand in a room
thermostatted at 25°C. Eight days after the
- 15 inoculation, the dead and alive were counted. The
mortality was calculated according to the following
equation and the insecticidal effect was judged
according to the criterion shown in Test Example 1.
The test was carried out with triplicate groups of 10
- 20 insects.

$$\text{Corrected mortality(\%)} = \frac{\begin{array}{c} \text{Number of} \\ \text{alive larvae in} \\ \text{untreated group} \end{array} - \begin{array}{c} \text{Number of} \\ \text{alive larvae in} \\ \text{treated group} \end{array}}{\begin{array}{c} \text{Number of} \\ \text{alive larvae in} \\ \text{untreated group} \end{array}} \times 100$$

Test Example 3: Insecticidal effect on smaller tea
tortrix (Adxophyes sp.)

Tea leaves were immersed for about 30 seconds in a liquid chemical prepared by diluting a preparation containing each compound listed in Tables 1 to 3 as an active ingredient to adjust the concentration to 50 ppm. After air-dryness, the tea leaves were placed in a plastic Petri dish with a diameter of 9 cm and inoculated with larvae of smaller tea tortrix, after which the dish was allowed to stand in a room thermostatted at 25°C and having a humidity of 70%. Eight days after the inoculation, the dead and alive were counted and the insecticidal effect was judged according to the criterion shown in Test Example 1. The test was carried out with triplicate groups of 10 insects.
